Chemistry

1. Introduction

Chemistry deals with the composition, structures and properties of matter, the interactions between different types of matter, and the relationship between matter and energy. At HKUGAC, it is possible to acquire relevant conceptual and procedural knowledge of chemistry from everyday experience. A study of chemistry also helps to develop understanding and appreciation of developments in engineering, medicine and other related scientific and technological fields. Furthermore, learning about the contributions, issues and problems related to innovations in chemistry will help students develop an understanding of the relationship between science, technology, society and the environment.

1.1 Teaching methods

Teachers will provide students with an appropriate level of curriculum and reasonable expectations to suit the capabilities of the students and to engage them in the process of learning.

1.1.1 Contextual approach

Throughout the senior secondary curriculum, students can develop their interest on certain compulsory topics. With a solid chemistry background, students can then making good choices as they progress to the school-based investigative study.

1.1.2 Scientific investigations

Students are expected to make use of their knowledge and understanding of chemistry, together with generic skills – including, but not limited to, creativity, critical thinking, communication and problem-solving – to engage in a group-based 20 hours of experimental investigative study.

1.1.3 Problem-based learning

A series of training is provided to train students' appropriate strategies to deal with issues that may arise. Students are expected to clarify and analyze problems related to chemistry. During which apply knowledge and principles of chemistry to solve problems or suggest creative ideas or solutions to problems.

1.1.4 Embedding of learning in real-life issues

By reading the latest research and industry products, students will be expected to appreciate the relationship between chemistry and other disciplines, and to be aware of the interconnections among science, technology, society and the environment in contemporary issues, thereby becoming responsible citizens.

1.2 Assessment

A variety of approaches and styles will be used for designing homework to motivate students and offer interesting and challenging tasks for students to do. Types of homework will include oral reports on observation, model-making, survey, writing research essay and laboratory reports. A combination of assessment methods such as checklists, quizzes, oral presentations, self-assessment and peer feedback will be used to report students' achievement. Teachers will also provide constructive feedback, written or verbal, to help students understand their strengths and /or weaknesses and to enhance student learning in everyday classroom lessons. The focus of the assessment is on why they do not learn well and how to help them to improve rather than just to use assessments to find out what knowledge students have learned. Recognition will be given to students with outstanding performance and encouraging remarks and praise will also be given to those who have made attempts to improve. While a school-based assessment (SBA) project will be done from S5 to S6 for students to sit the HKDSE Chemistry examination. Students will be guided to finish practical related tasks and non-practical related tasks.

2. The aims and objectives

The curriculum is designed to enable students to:

- 1. develop interest and maintain a sense of wonder and curiosity about chemistry;
- 2. construct and apply knowledge of chemistry, and appreciate the relationship between chemistry and other disciplines;
- 3. understand and evaluate the social, ethical, economic, environmental and technological implications of chemistry, and develop an attitude of responsible citizenship.

3. Curriculum

The curriculum emphasizes to strengthen students' ability to:

- 1. understand of the nature of scientific inquiry in chemistry;
- 2. develop them to be a person who can think scientifically, critically and creatively, and solve problems individually and collaboratively in chemistry-related contexts;
- 3. develop open-mindedness, objectivity and pro-activeness.

3.1 Curriculum framework

		Topics		
Part	S4	Microscopic world I ➤ identify the bonding and structure of some chemical compounds		
		predict the chemical and physical properties of different structures		
		<u>Metals</u>		
		design appropriate experiment to identify the reactivity of different metals		
Compulsory		illustrate the factors that speed up / slow down the corrosion of metals		
		➤ balance chemical and ionic equations		
		Reacting masses		
		determine the empirical formula and molecular formula of chemical compound		
		determine the molar concentration of a solution		
		➤ determine the molar volume of gas		
		➤ identify the limiting reactant in a chemical reaction		

Acids and Bases

- > identify acids and bases
- predict chemical reactions between acids/bases with different chemical compounds
- illustrate acidity and alkalinity with pH value
- > prepare different chemical salts by using different chemical reactions
- analysis the amount of chemicals in a certain sample quantitatively

Fossil Fuels and carbon compounds

- > identify organic compounds
- understand the refining of petroleum
- predict the chemical reactions of different alkanes and alkenes
- understand the formation of polymer

Microscopic world II

- predict the shape of a molecule
- illustrate polarity of a molecule
- predict the strength of intermolecular forces based on dipole moment

Redox reaction

- identify redox reaction
- determine oxidation number and its application
- identify oxidizing agent / reducing agent
- illustrate the importance of redox reaction

Chemical cells and electrolysis

- understand the structure of a chemical cell and electrolytic cell
- determine the factors that can maximize the potentials of different cells

Chemical reactions and energy

- understand the conservation of energy
- identify the difference between exothermic and endothermic reactions
- interpret the meaning of $\Delta^{\circ}H$

Rate of reaction

S5

Compulsory Part

- determine the rate of reaction
- identify the factors that affect the rate of reaction
- design experiments for to determine the rate of reaction

Chemical equilibrium

- understand the meaning of equilibrium
- determine the equilibrium constant of a chemical reaction
- ➤ determine factors affecting the equilibrium constant

Chemistry of carbon compounds

- identify organic compounds from its homologous series
- classify structural, geometrical isomerism
- identifying enantiomers with chiral carbon

Pattern in Chemical World

- identify the trends of bonding and structures in Period 2
- understand the trends of oxides of Period 3 elements and their properties
- understand the general properties of transition metals and their usage

Elective Part	S6	Industrial Chemistry determine the rate equation from experimental results determine the activation energy of a chemical reaction from the rate constant identify different types of catalyst understanding the conversion of materials in industrial process
		Analytical Chemistry detect the presence of come typical chemical species separate and purify chemical species from its mixture analyze chemicals quantitatively by gravimetric and volumetric methods understand the daily application of analytical chemistry

3.2 Delivery Schedule

1st Term	S.4	S.5	S.6
Week 1A	Planet Earth	Migroscopia World II	
Week 1B	Matala/strutfuss	Microscopic World II	
Week 2A	Metals(start from displacement reactions)		Analytical Chemistry
Week 2B	аізріасетені теасіюні)		
Week 3A			
Week 3B	Reacting Masses		
Week 4A		Redox Reactions	Industrial Chemistry
Week 4B		Redox Reactions	
Week 5A			
Week 5B			
Week 6A			
Week 6B	Acids and Bases		Consolidation
Week 7A			Consolidation
Week 7B		Chemical cells and	
Week 8A		Electrolysis	
Week 8B			

2nd Term			
Week 1A		Chemical Reactions and	Mock exam
Week 1B	Acids and Bases	Energy	WIOCK Exam
Week 2A			
Week 2B		Rate of Reaction	
Week 3A			
Week 3B			
Week 4A		Chamical Equilibrium	
Week 4B		Chemical Equilibrium	
Week 5A	Fossil Fuels and Carbon		
Week 5B			
Week 6A	Compounds		
Week 6B		Chamistry of Carbon	
Week 7A		Chemistry of Carbon Compounds	
Week 7B		Compounds	
Week 8A			
Week 8B			
Week 9A	Migroscopia World II	Patterns in the Chemical	
Week 9B	Microscopic World II	World	

4. Assessment

4.1 Assessment Criteria

4.1.1 Assessment of knowledge and understanding

Students should be able to demonstrate knowledge and understanding in relation to

- 1. phenomena, facts and concepts in science;
- 2. scientific vocabulary and terminology;
- 3. application of concepts to familiar and unfamiliar situations;
- 4. application of science in society and students' everyday life.

Oral questioning, class assignments, module tests and examination can be used to allow students to demonstrate their understanding and creative ideas.

4.1.2 Application of scientific processes

Students should be able to

- 1. ask relevant questions, identify problems and formulate hypotheses for investigations;
- 2. select and apply facts and concepts learnt to solve problems;
- 3. plan scientific investigations individually and collaboratively with appropriate instruments and methods;
- 4. collect and analyze data, make further predictions, draw conclusions and present scientific information effectively.

Project work provides excellent opportunities for students to apply what they have learnt. Investigative projects, in particular, are suitable for assessing enquiry skills such as identifying problems, formulating hypotheses and designing strategies to solve problems scientifically and creatively.

4.1.3 Assessment of experimental skills

Students should be able to

- 1. handle apparatus and chemicals safely and properly;
- 2. carry out instructions for experiments;
- 3. observe and describe objects and experimental results accurately:
- 4. select appropriate apparatus and suggest experimental procedures.

The most suitable methods for assessing science skills are practical assessment. Students are required to perform numbers of practical tasks. They are expected to make use of their knowledge and understanding of science in performing these tasks. Through these practical tasks, students' practical, process and generic skills will be developed and assessed.

4.1.4 Assessment of attitudes

Students should

- 1. develop curiosity and interest in science;
- 2. be aware of the importance of the safety of oneself and others in the laboratory and be committed to safe practices in daily life;
- 3. develop personal integrity through honest recording of experimental data;
- 4. develop an awareness of scientific advancement and its social, economic, environmental and technological implications;
- 5. be willing to communicate and comment on issues related to science and respect the decisions of others:
- 6. develop a positive attitude in enhancing personal and community health;
- 7. show concern for the care of the environment and a willingness to contribute to it.

Attitudes such as curiosity, perseverance, care and concern for living things, and co-operation with others are important in science learning. As these attitudes take time to develop, their assessment should take place over a period of time to show the progress that students have made. Some common means of assessing attitudes include, observing behaviour, asking students to write essays, and using questionnaires.

4.2 Weighting of component parts

Commonant	Weighting		
Component	S4	S5	S6
Continuous assessment			
➤ E-learning	40%		
> Assignments			
Uniform tests			
Examination		60%	

4.3 Grading system

7	>=85.5%
6	>=79.5%
5	>=70.5%
4	>=59.5%
3	>=49.5%
2	>=39.5%
1	>=0%

4.4 School-based assessment for the HKDSE Chemistry examination

As stipulated in the Chemistry Curriculum and Assessment Guide (Secondary 4-6) from HKEAA, there is a school-based assessment (SBA) component constituting part of the public assessment of the subjects.

SBA should be an integral part of the learning and teaching process, and involves assessment of students' performance at different times during their courses. It must be emphasised that a series of mini examinations is not intended. With SBA, teachers can provide appropriate feedback to students so as to help consolidate the learning of concepts related to chemistry and scientific investigative skills, and foster the development of generic skills such as creativity, critical thinking, communication and problem-solving.

For students sitting for the HKDSE Chemistry examination in 2012 and onwards, the mark of SBA in practical related tasks will contribute to 20% of the final subject mark, which the public examination contributes to 80%.

4.4.1 SBA Requirement

The SBA of Chemistry and Combined Science (Chemistry part) covers the assessment of students' performances in practical work in their S5 and S6 years of the course. Candidates are required to perform a stipulated amount of practical work, which may include designing experiments, reporting and interpreting experimental results, etc. The work should be integrated closely with the curriculum and form a part of the normal learning and teaching process. Apart from these, candidates attempting the HKDSE Chemistry examination may also be required to design and conduct a group-based experimental investigative study with a view to solving an authentic problem. They are expected to make use of their knowledge and understanding of chemistry in performing such an investigative study, through which their generic skills, practical skills, process skills and reporting skills, etc. would be developed and assessed.

4.4.2 Assessment Requirement for Chemistry

For each candidate attempting the HKDSE Chemistry examination for the first time, the minimum numbers of assessments and the weightings in subject required in S5 and S6 for the SBA are summarised in the table below:

	Minimum number of assessments*	Weighting in subject
S5	2	10%
S6	2	10%

^{*} Over the two years of S5 and S6, there should be at least one assessment for Volumetric Analysis (VA), one assessment for Qualitative Analysis (QA) and two assessments for Other Experiments (EXPT).

* Investigative Study (IS) can be done in lieu of Other Experiments (EXPT). In this case, one assessment on 'proposal' and one assessment on 'process and report' should be performed. These two assessments can satisfy the minimum requirement for Other Experiments (EXPT).

5. Role of parents at home and homework

Efficient time management is essential for students to be successful in the subject. Students are encouraged to come to each lesson with full preparation according to the guided task given and questions to be asked as a means to promote effective learning. Homework consolidates, reinforces and strengthens concepts learnt in class and helps teachers assess the performance of students. Parents are encouraged to talk to their son or daughter about the work done in class and the current learning topics in order to have a better understanding of the learning situation in the subject.
